

Search & Filtering Design Doc

Overview

This document describes search and filtering behavior for the product catalog. Users should be able to find relevant products quickly using free-text search combined with category and price filters.

Search Relevance

Search results must be ranked by relevance to the query, with exact title matches ranked above partial matches. Out-of-stock items are still shown but ranked below in-stock items with equal relevance.

Filtering

Users can narrow search results using category and price range filters. Multiple filters combine with AND logic. Applying a filter that yields zero results must show a clear empty state rather than an error.

No-Results Handling

When a search query returns no matches, the system suggests related categories instead of leaving the results area blank. Suggestions are based on the most frequently browsed categories.
